## **EUROPEAN STANDARDS IN CONSTRUCTION DRAWINGS**

Technical and Construction Drawings for Civil Engineering Constructions undergo standardization according to the regulations and requirements set up by the CEN and CENELEC organizations. At each European country the standards for technical drawings and construction drawings undergo standardization according to EN standards. The national standards must comply with the EU standards and thus the process of translation has started in Poland already in the 90s of the last century. Although the work has not been completed yet, the educators must remember that the new standards are obligatory and the students must become familiar with them. Transformation process between the old and the new will take some more time. However, the future engineer must be aware of the changes which take place in the environment of technical/construction drawings.
